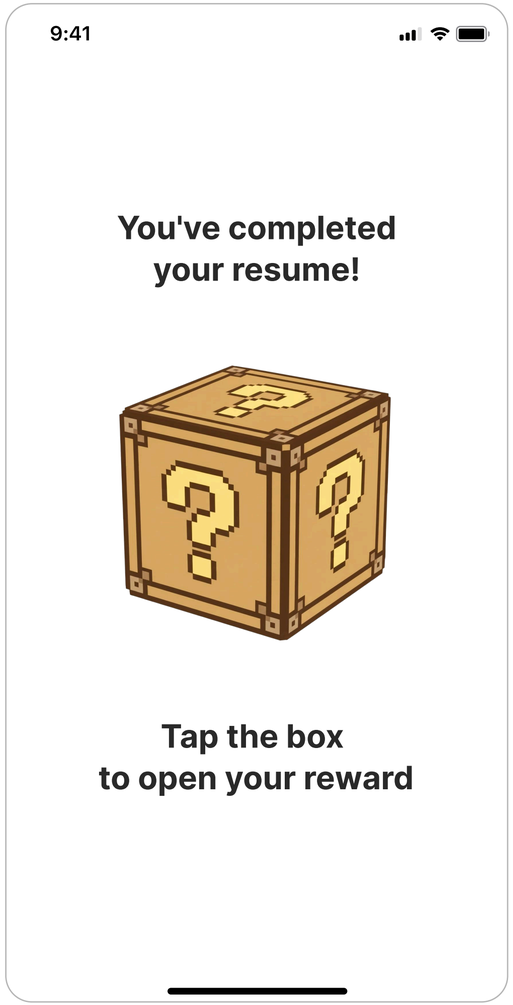
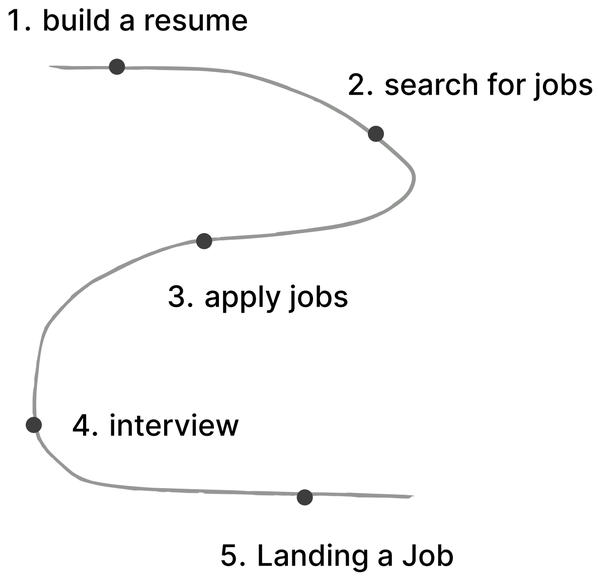
Candy Steps

- Technique: Figma Mockup
- Requirement Addressed: Reduce anxiety by making career re-entry feel manageable and rewarding.
- Ideation Strategy: Gamification / Analogous Inspiration
- Research Insights:

Candy Steps breaks the overwhelming return-to-work process into small, achievable challenges that help mothers recognize their progress and rebuild confidence. After completing career-related goals, users unlock digital candy that can be exchanged for real candy to share with their children.





Care & Career

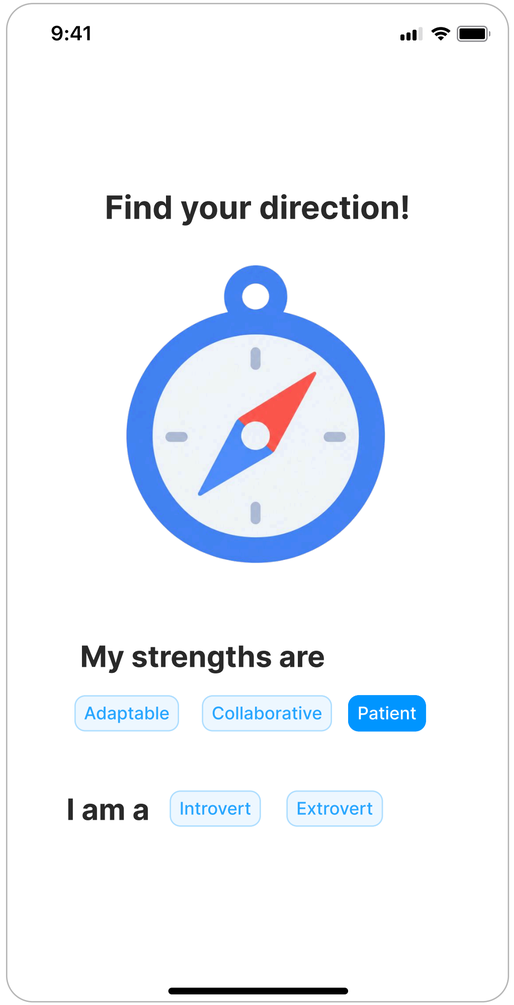
- Visualization Method: Digital Collage
- Requirement Addressed: Connect caregiving support with flexible employment and career resources.
- Ideation Strategy: SCAMPER, Combine (childcare + career support)

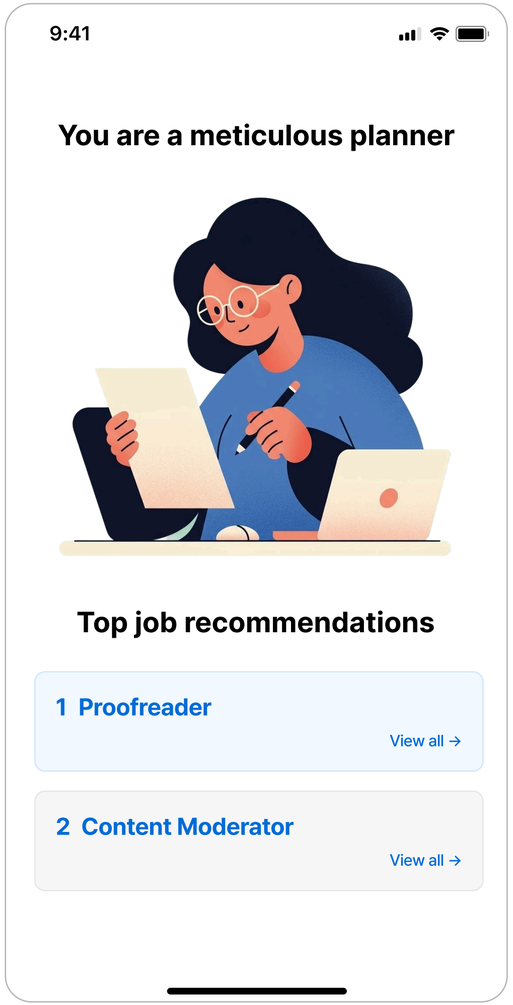
Care & Career Cooperative combines community-based childcare with career support and flexible employment opportunities in one service. Parents can access childcare while preparing for work and may also apply for paid positions at the center or its partner organizations.

Career Compass

- Visualization Method: Figma Mockup
- Requirement Addressed: Help parents identify realistic career directions and relevant opportunities without navigating overwhelming job lists.
- Ideation Strategy: Personalization and location-based matching

Career Compass reduces the overwhelm of browsing endless job listings by first identifying each parent's strengths, work preferences, resume experience, caregiving needs, and location. The service recommends suitable career paths before providing a curated list of nearby job opportunities, with clear explanations of why each option fits.





Returnship Pathway

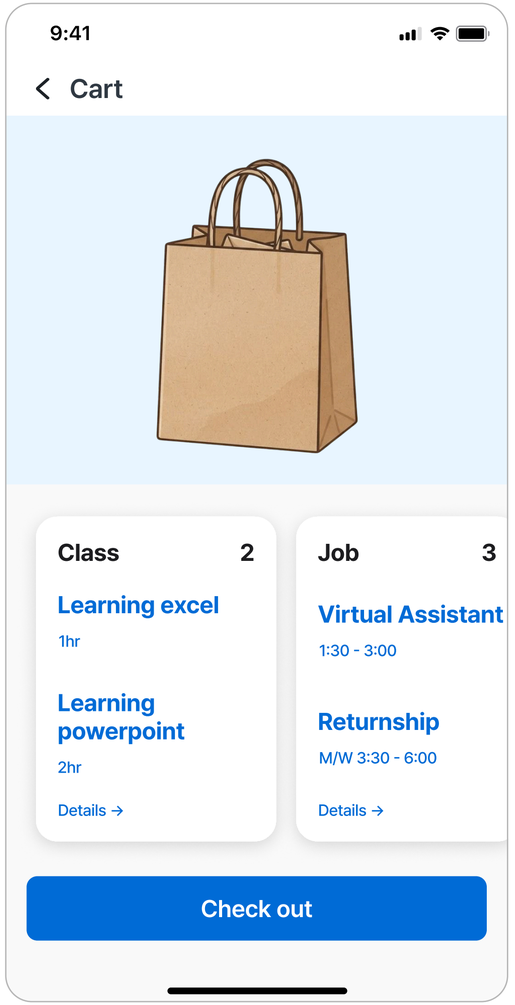
- Requirement Addressed: Help parents identify skill gaps and prepare for return-to-work opportunities without taking unnecessary training.
- Ideation Strategy: SCAMPER, Combine
- Visualization Method: collage

Returnship Pathway connects parents with suitable returnship opportunities and shows which skills they may need before applying. It creates a personalized pathway linking relevant short courses and preparation milestones to each opportunity.

Career Cart

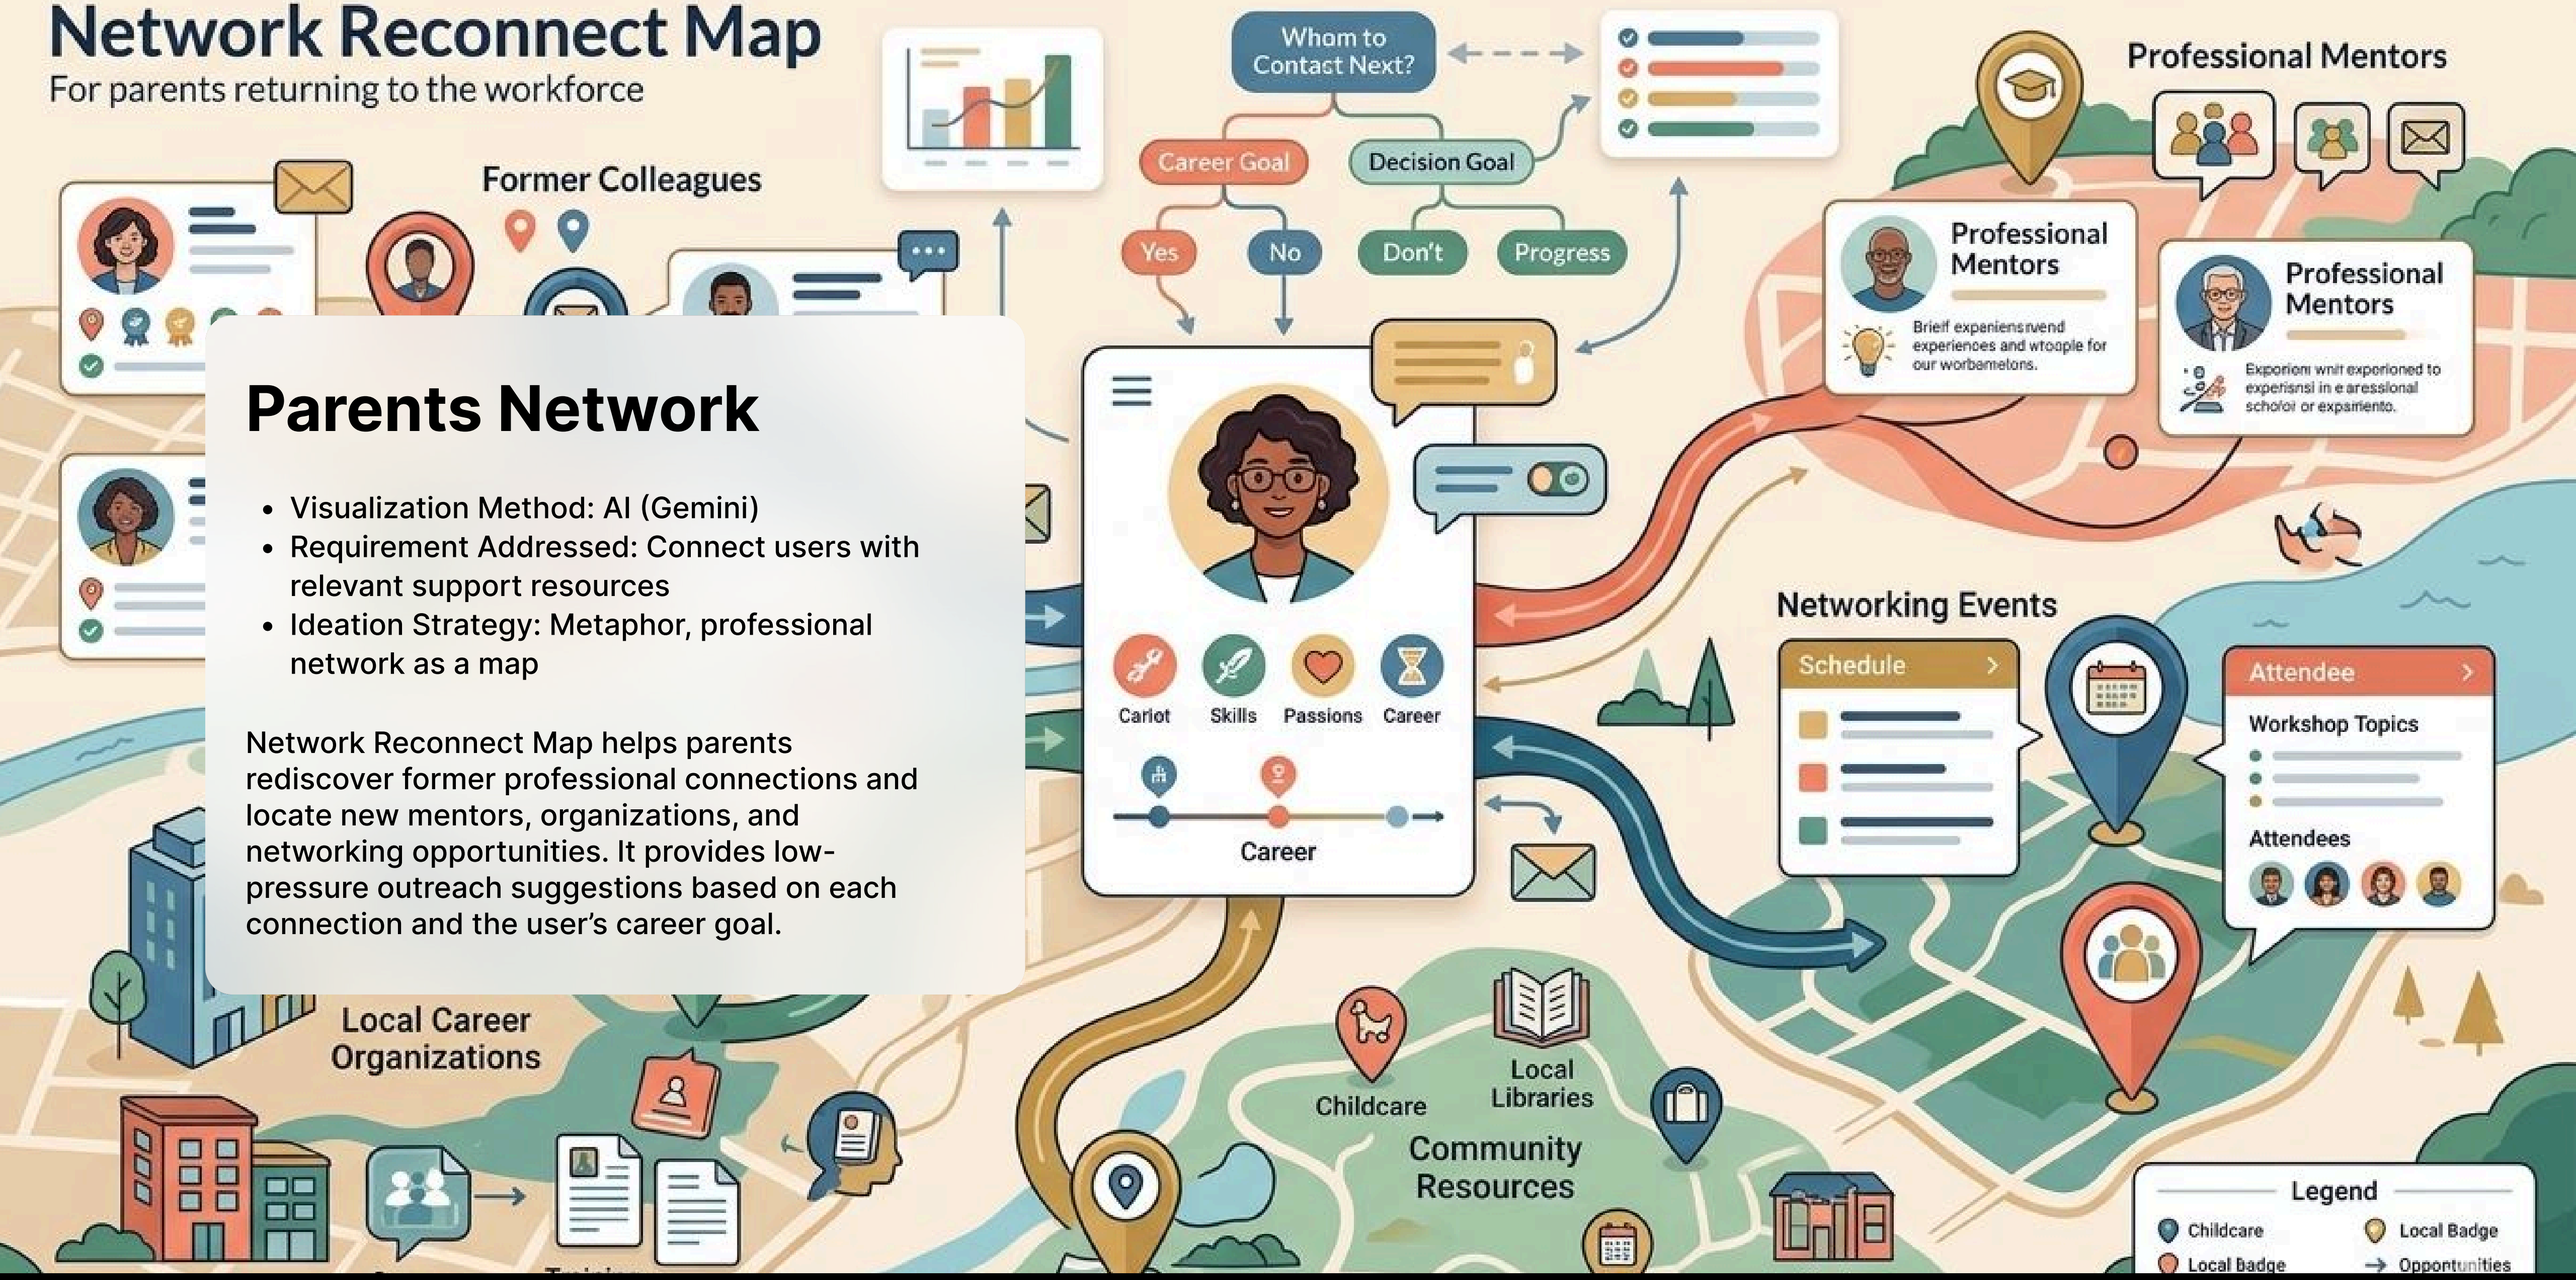
- Ideation Strategy: Analogous Inspiration from grocery shopping and online checkout
- Visualization Method: Figma Mockup
- Requirement Addressed: Help parents coordinate fragmented resources into one realistic return-to-work plan.

Career Cart allows parents to assemble a personalized return-to-work package by adding a job opportunity, required training, childcare, transportation, and career support to one cart. The service checks whether the selected resources work together in terms of schedule, location, cost, and eligibility before the user begins the plan.



Network Reconnect Map

For parents returning to the workforce



Parents Network

- Visualization Method: AI (Gemini)
- Requirement Addressed: Connect users with relevant support resources
- Ideation Strategy: Metaphor, professional network as a map

Network Reconnect Map helps parents rediscover former professional connections and locate new mentors, organizations, and networking opportunities. It provides low-pressure outreach suggestions based on each connection and the user's career goal.

Prompt: Create an image showing parents reconnecting with former coworkers, mentors, and career organizations through a network map. Draw a polished conceptual illustration of a service called "Network Reconnect Map" for parents returning to the workforce after a caregiving career break. Show a central user profile connected through map-like pathways to former colleagues, professional mentors, local career organizations, networking events, and community resources. Use location pins, connection lines, profile cards, and message icons to communicate reconnecting with existing contacts, discovering new professional connections, and deciding whom to contact next. Use a modern, warm, presentation-friendly visual style in landscape orientation. Do not include company logos or readable text.

Talk Before Apply

- Requirement Addressed: Reduce career-gap bias by allowing candidates to communicate their experience and current readiness before being evaluated only through a resume.
- Ideation Strategy: Analogous Inspiration from matching apps
- Visualization Method: AI (Gemini)

Talk Before Apply allows parents returning to work to have a short, low-pressure conversation with recruiters before submitting a formal application. If both sides see a potential fit, the recruiter invites the candidate to continue to the application or interview stage.

Prompt: Create an illustration of a parent returning to work matching and talking with a recruiter before applying for a job. Create a polished conceptual illustration for a career-reentry service called “Talk Before Apply.” Show two skill-based profile cards, one representing a parent returning to the workforce and the other representing a recruiter, connected through a mutual matching process. Visualize the service flow from reviewing skills and work preferences, to mutual interest, to a short introductory chat, and finally to an invitation to apply or interview. Focus the candidate profile on current skills, previous experience, preferred work arrangement, availability, and career goals rather than appearance or employment dates. Use message bubbles, matching symbols, and an interview invitation card. Use a modern, warm, trustworthy, presentation-friendly editorial illustration style in landscape orientation. No company logos and no readable text.

Care Loop Pods

- Requirement Addressed: Expand access to childcare while creating flexible employment opportunities for returning parents.
- Ideation Strategy: SCAMPER, Combine Childcare pod + parent employment + cooperative membership model
- Visualization Method: AI (Gemini)

Care Loop Pods employ parents at neighborhood childcare pods while providing short-term care for other parents attending interviews, training, or work. After returning to employment, participating parents contribute an affordable membership fee that helps fund the pods and create additional childcare jobs for other parents.

Prompt: Show the concept as a cycle: childcare support, career activities, employment, membership contributions, and new childcare jobs. Revise the illustration to emphasize the circular service model rather than only showing a childcare center. Clearly visualize five connected stages: accessing short-term childcare, participating in career activities, securing employment, contributing through an income-based membership model, and funding new childcare jobs for other returning parents. Show that some returning parents are employed within the childcare pods and that the system supports the next group of parents. Use clear arrows and distinct visual stages, and reduce decorative elements.

Resource Puzzle

- Ideation Strategy: Metaphor, fragmented resources as puzzle pieces
- Visualization Method: AI (Gemini)
- Requirement Addressed: Connect fragmented support resources by registering individual organizations into one coordinated puzzle platform.

Resource Puzzle integrates fragmented community organizations into a single app platform. By having various entities register as individual puzzle pieces, the app allows parents to view and combine multiple services all at once. The platform seamlessly assembles these registered organizational features into a personalized, all-in-one return-to-work plan.

Prompt: Make the puzzle pieces flatter, more geometric, and more sophisticated. Remove cartoon-like outlined icons and replace them with simple, minimal symbols. Emphasize the transformation from scattered career, childcare, training, transportation, and financial resources into one coordinated return-to-work support system. The illustration should resemble a contemporary service-design visualization rather than an educational worksheet or corporate stock infographic.

Career Constellation

- Ideation Strategy: Metaphor, shared experiences as stars that form constellations
- Visualization Method: Hand Sketch with Digital Retouching + digital coloring (figma)
- Requirement Addressed: Help parents share experience-based guidance and support from others facing similar career-reentry challenges and concerns.

Career Constellation allows parents to post career-reentry questions as individual stars and receive advice from others who have faced similar situations. As related experiences and resources connect, they form constellations that help users follow a clearer path toward their own “North Star.”

- Observation vs Semi-Structured Interview
  pro-
  con-

- Contextual Interview vs Semi-Structured Interview
  pro- user is an expert, so interviewer can learn things from interviewees. Also can undertand participants' live behaviors within contextual environment such as what tools they are using or verbal and facial expression they do when they face problems. Also, this interview is conducted within flexible questions based on interviewees behave. so, interviewee can achieve more deep dived answers from interviewees
  con- this might be hard for analysis because the interview questions will be varied based interviewees. It might be difficult to compare with other interviewees's contextual interview and it might require more time for interviewer to analyze the answers.

  pro- opportunities to ask follow up questions which helps the interviews to obtain qualitative data from interviewee. Moreover, interviewer can get data for strict questions and flexible questions. So, this helps us to compare answers from diverse interviewees.

  cons- This might more take time to compare questions from various interviewees because not all the questions are provided identically for interviewees. Also, need to put more effort to comapre and analyze the data.

- Survey vs Semi-Structured Interview
- Accessible Design vs Universal Design vs Inclusive Design
- Medical Model vs Social Model
- Research Goal vs Research Question vs Method

Career Compass 🧭 + Returnship Pathway

Parent caregiving Job

Time

1. more than 50 years ago

Parent and job_ the structure of the family was different.
Usually mothers were focusing on their household and fathers went out for working.
→ Mostly 1 person in the family went out for work

2. Thesedays

More mothers go out for working. Globall trend is more than 60% of families with children are dual-earner households

Job

1. automation has reduced physical labor and it leads to less labor-intensive global economy.
2. working hour is more flexible now. Temporal flexibility
3. porb_However, why still parents who want to return to their work are hard to go back?
4. physical scale of job market is smaller now, but non-physical scale (online job market) is growing and really huge now.
